

WATER QUALITY TEST KITS

Domestic Animals

FROM YOUR BELOVED DOG TO YOUR PRIZED QUARTER HORSE, ALL DOMESTIC ANIMALS FUNCTION BETTER WITH SAFE WATER

Is your pet's water safe? Don't guess...TEST!®

THE IMPORTANCE OF TESTING YOUR PET'S WATER

Pets and livestock require an abundance of clean drinking water as part of their daily diets to support the vital functions of their bodies. Water containing high levels of contaminants can impair and even cause irreversible damage to their organs (reproductive, urinary, circulatory, respiratory, and digestive).

Testing the water that domestic animals consume is the only way to detect unsafe contamination levels. When we provide our pets continuous access to clean drinking water, we are helping them fend off disease, reproduce healthy offspring, perform better, and live longer lives. Safe Home test kits for domestic animals are designed for testing freshwater sources, such as but not limited to:

- Well Water
- Municipal Water
- Spring Water
- Rain Water
- Filtered Water
- Lake Water
- Pond Water
- Bottled Water
- River Water

THE DIFFERENCE

The architecture of the Safe Home test kit structure is supported by our parent company, Environmental Laboratories Inc., one of the largest EPA-certified drinking water testing laboratories in North America. We are the only drinking water testing entity in the US that provides an A to Z platform for guiding consumers to safer water.

GUARANTEED QUALITY

Third-party testing is also important to the integrity and transparency of our brand. We have provided our test kits to various entities for vetting, including, among others, American Red Cross Laboratories, Merck Laboratories, Underwriter Laboratories, and Good Housekeeping Laboratories.

WHERE TO PLACE PRODUCT

My Pet test kits for domestic animals can be sold in any brick-and-mortar store or online pet supply retailer. They can also be sold through veterinary offices.

We offer comprehensive testing options.

Do-It-Yourself Testing

DIY testing is a great way to screen your pet's water for parameters that may be at unsafe contamination levels. This testing option is most suitable for routine water quality maintenance. Test results develop on the spot, allowing quick action to be taken if water quality results are substandard. The My Pet™ Water Quality Test Kit: Deluxe Do-It-Yourself Testing Package for domestic animals provides approximate values for 20 different parameters.

"Our beloved pet parrot, Cece, began behaving oddly one day. She kept falling from her perch, repeatedly banged her head on the cage, and refused to eat. Our vet ran some tests on Cece, and the findings shocked us—she had Lead Poisoning! At the vet's recommendation, we promptly tested our home's water using a My Pet Deluxe DIY test kit, and found out that our water supply was contaminated with high levels of Lead. Our house was newly constructed...so how was this possible? It turned out that Lead was being leached out of old supply line pipes from the water main, coming straight into our home. We now test our water regularly. It's an essential part of keeping our human and animal family members safe."

Lab Certified Testing

In-Lab water quality test kits from Safe Home provide testing at our EPA-certified laboratory. These test kits issue the most detailed test results possible—many times in parts-per-million and to three decimal places—for multiple parameters in water sources being used by pets and livestock. The My Pet™ In-Lab Water Quality Test Kit: Champion Testing Package for domestic animals tests for 55 different parameters, and the My Pet™ In-Lab Water Quality Test Kit: Grand Champion Testing Package for domestic animals tests for over 200 different parameters. Each kit informs the end user if parameters in the water are at dangerous levels. A certified lab report of test results is available online 24/7 and viewable on any device.

"Our cat and dog both died unexpectedly within months of each other. After testing many things to find answers, we tried the My Pet Champion In-Lab test kit. Safe Home's scientists suggested that we test the puddles of rain water under our deck, where our pets would often drink. The lab results detected lethal levels of Arsenic and Chromium in the water. Our pets had been fatally poisoned. These metals were leached from the treated lumber of our deck by acidic rains, and then accumulated in the puddles on the ground below. We share this story today as a cautionary tale about pervasive toxic chemicals in everyday items that can easily be accessed by and bring harm to our pets."

REAL CUSTOMER EXPERIENCE

-Jonathan from New York

"We own a large ranch where we live and breed horses. Our horses' drinking water came from our well supply, while the water we used in our home came from a treated, city water supply. Years after buying the ranch, our breeding stock was suddenly getting sick, and the foals born by our mares were deformed or stillborn. Our breeding stock was dying, and we were losing our livelihood, so we were more determined than ever to figure out what was going on. With a My Pet Grand Champion In-Lab test kit, we discovered toxic levels of organic compounds (carcinogens) contaminating our well water. Investigations brought to light that a factory over 50 miles away was dumping these chemical compounds on their ground. These carcinogens eventually penetrated the same aquifer that our well was drilled into. We now use city water for both our home and livestock."
